How to mod DELTARUNE on your mac

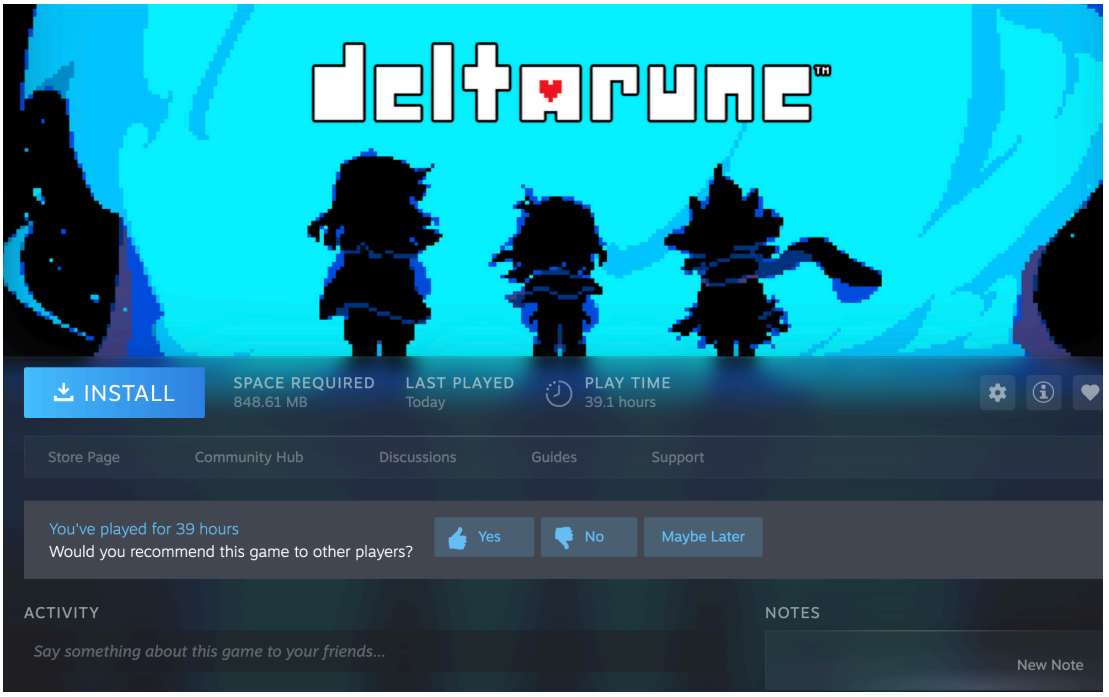

1) Open your browser and type in steam://nav/console
2) Press open Steam, there will be a console tab after loading it up

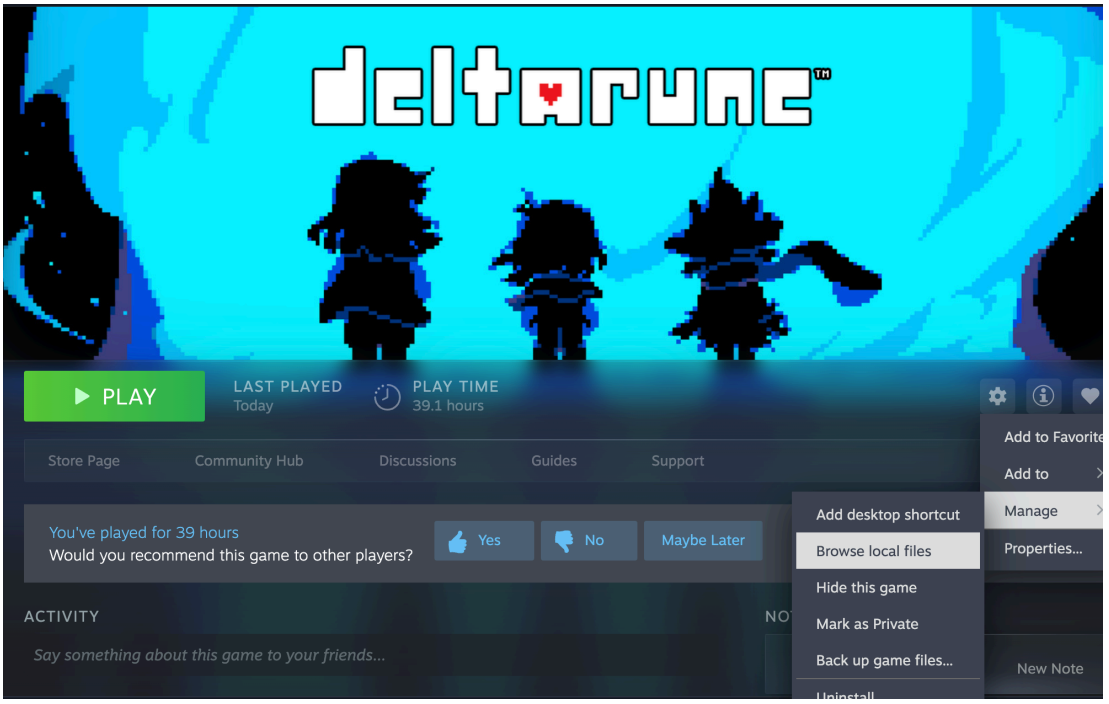

3) Open the console and type(or just copy it from here lol)
   “@sSteamCmdForcePlatformType windows”

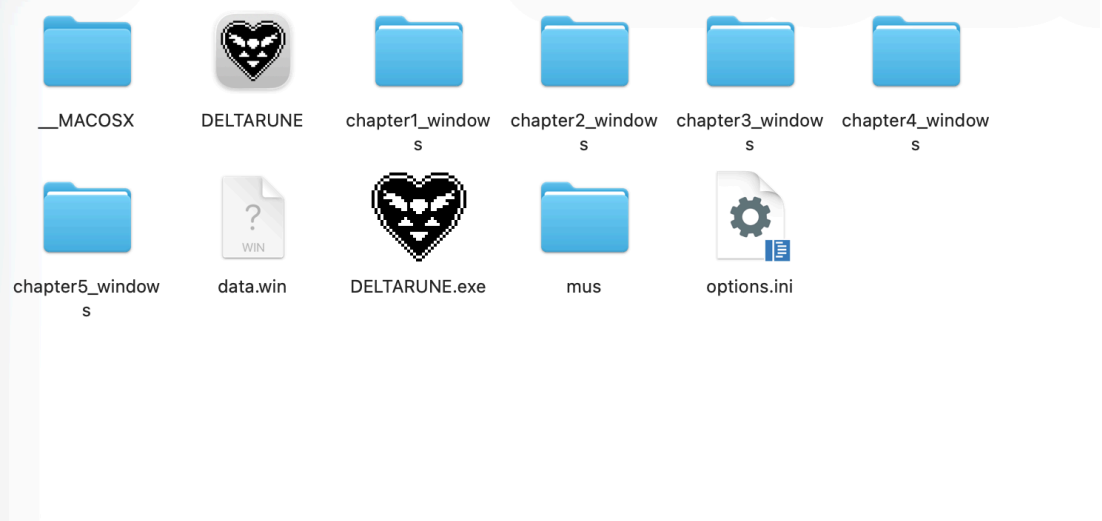

4) After you enter that and press return, in the same Steam session uninstall DELTARUNE and reinstall it. This will download Windows files.

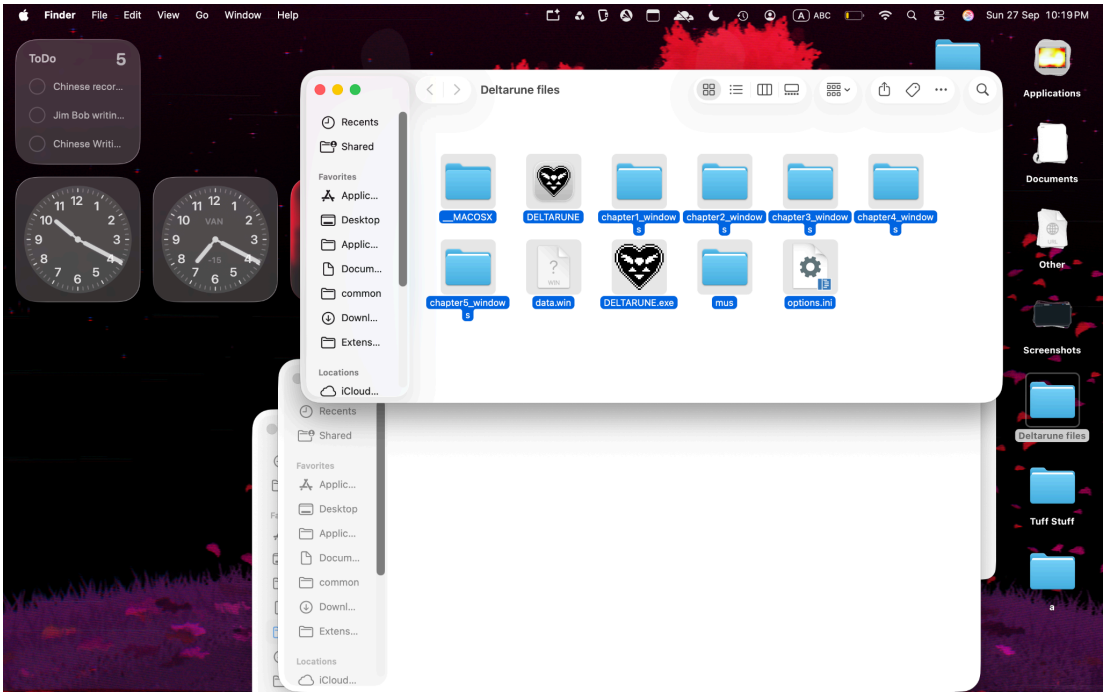

5) After it finishes downloading, press Browse local files

6) Open the finder window, it should look like this, with a .exe instead of a .app, if its not downloaded correctly or doesn't have all these files, uninstall and redownload

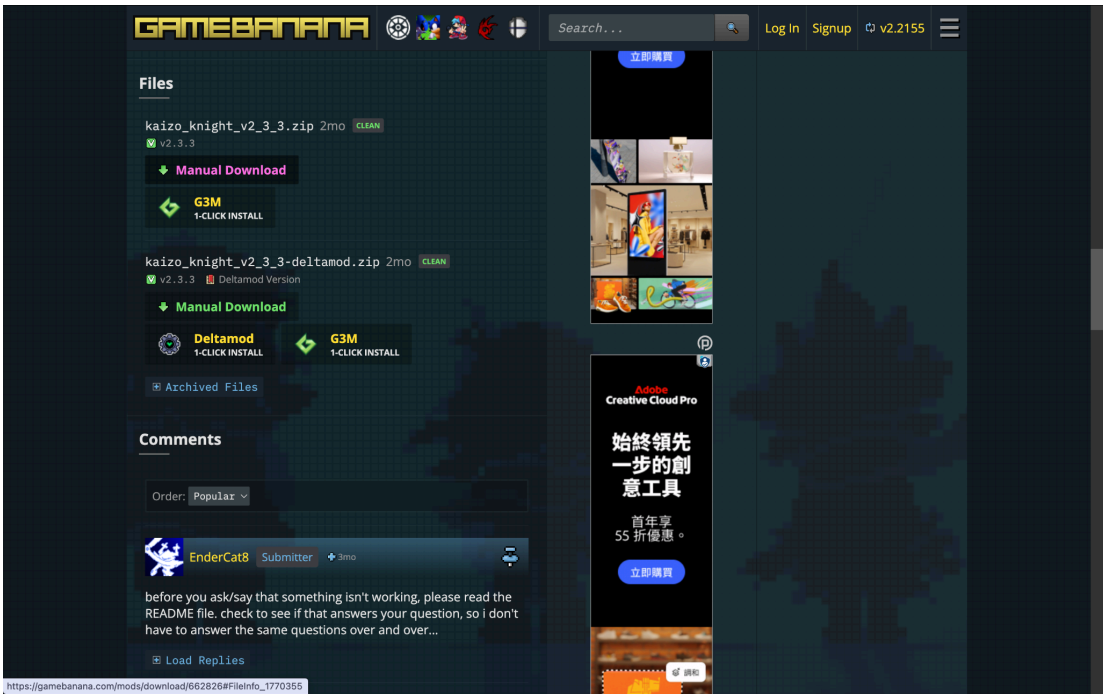

7) Now what you want to do is drag all these files into a folder on your desktop, like this

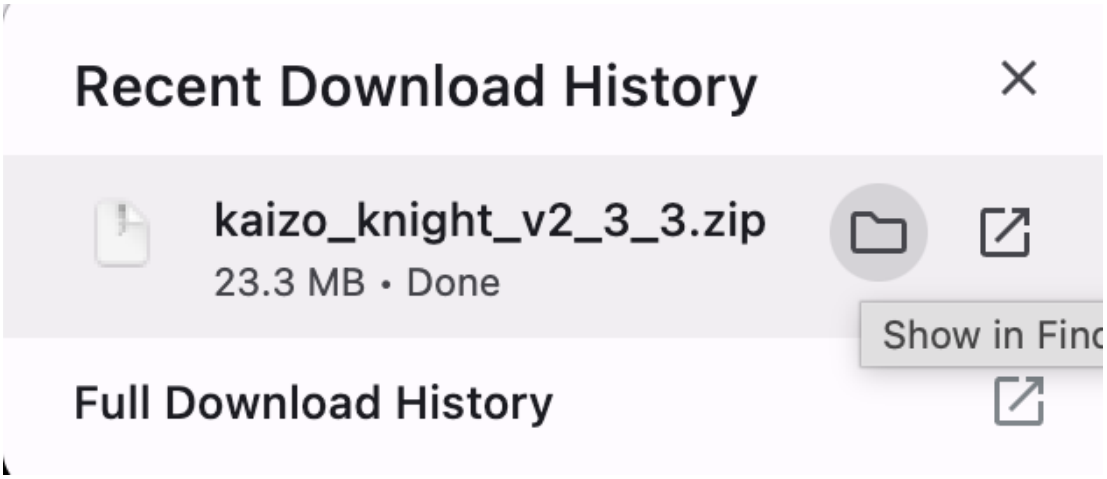

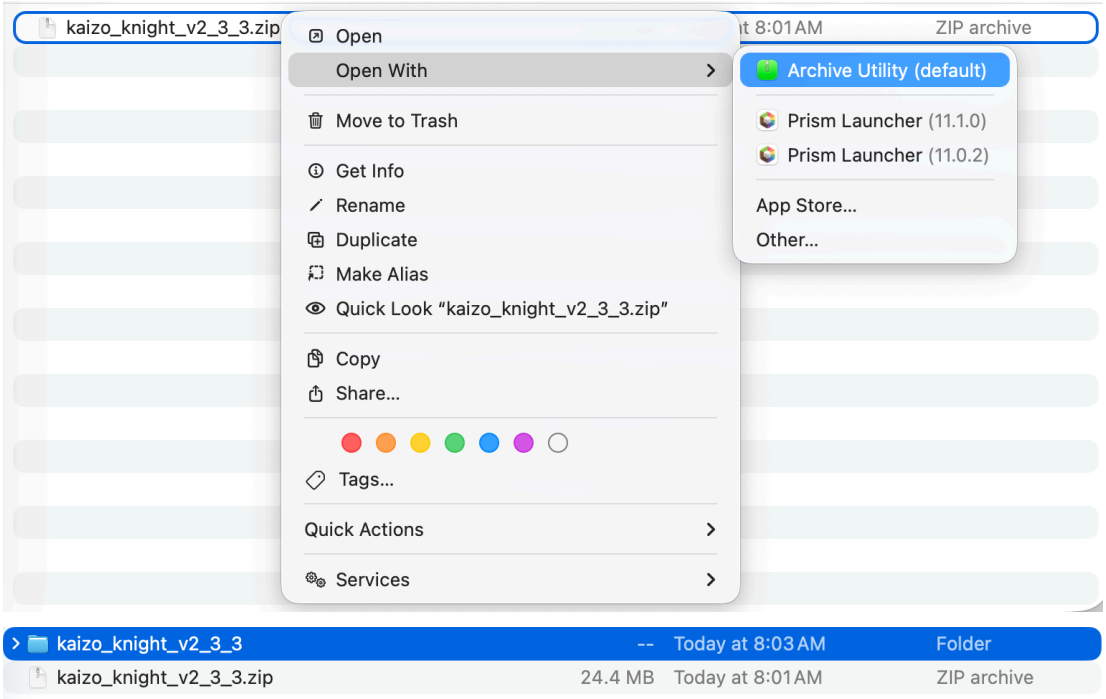

8) Next, get Deltapatcher from [this Github Releases page], this is crucial for modding DELTARUNE as most DELTARUNE mods are patched using Deltapatcher.
9) Next, download the mod you would like to install, in my case, I will be installing the Kaizo Knight mod, when installing, look for a manual download over a Deltamod of

G3M one

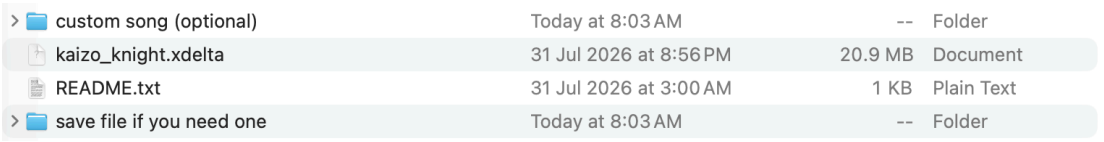

10) After it finishes downloading, head to the directory/folder where your files are downloaded, or press the show in finder button next to the downloaded file and right click on it and click on open with Archive Utility

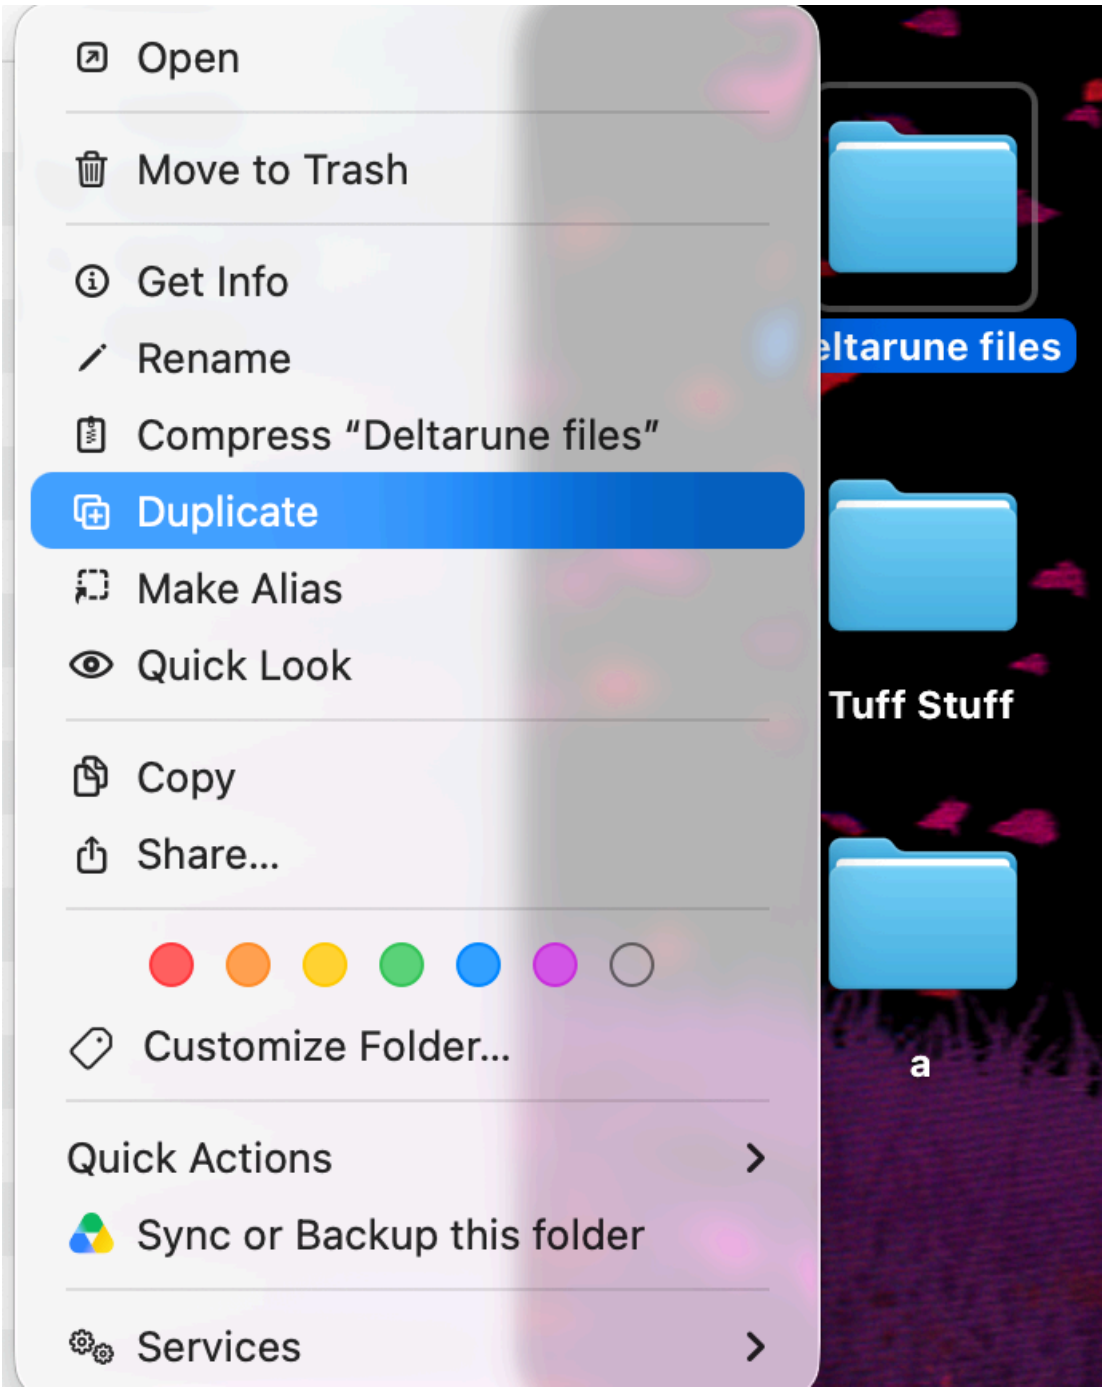

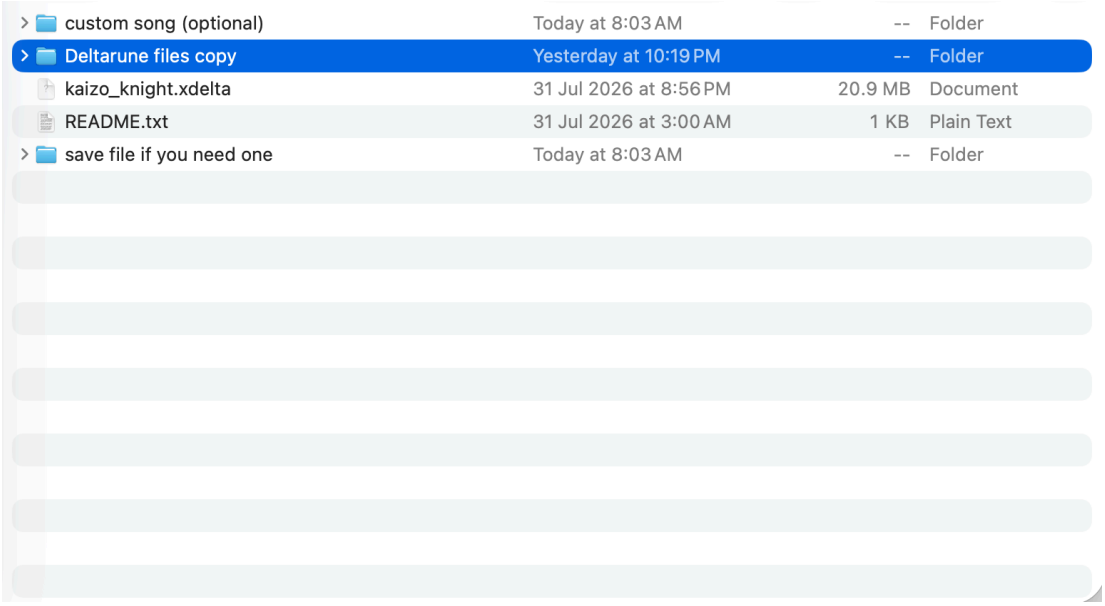

11) Next, this depends on the mod you want to install. If, when you open the folder, you see a .xdelta file, it means it's most likely compatible, but if there is no .xdelta or similar file, the mod might not be compatible. Unless the directory has a data.win file. This is what my folder looks like.

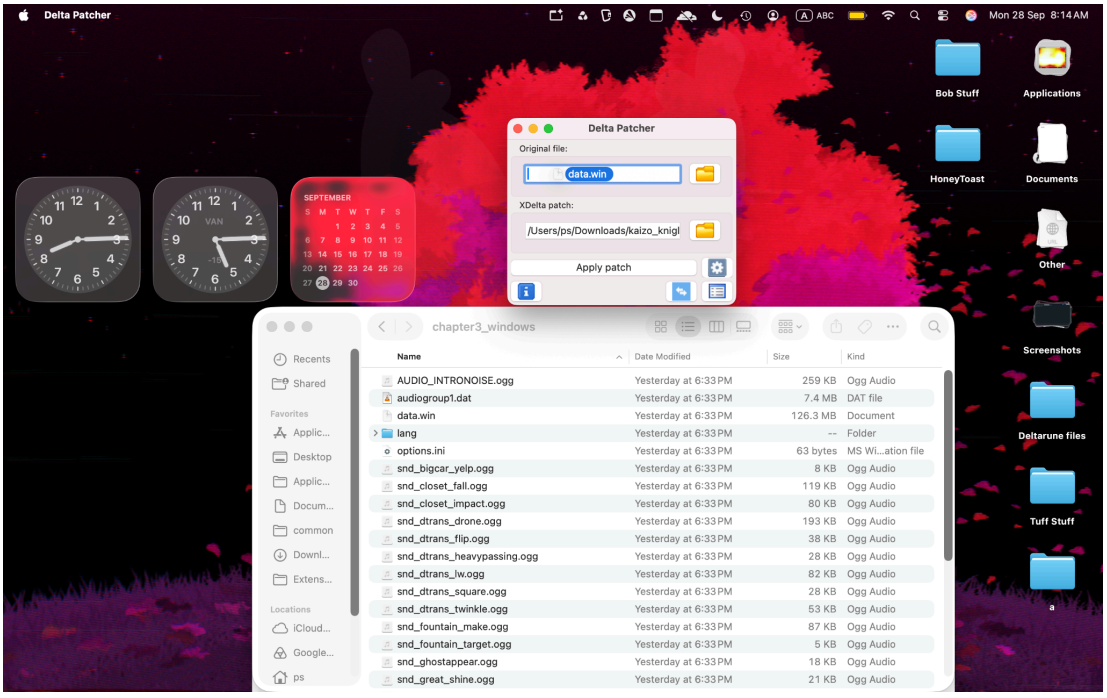

12) Next, duplicate the file on your desktop and drag the copy into the mod directory

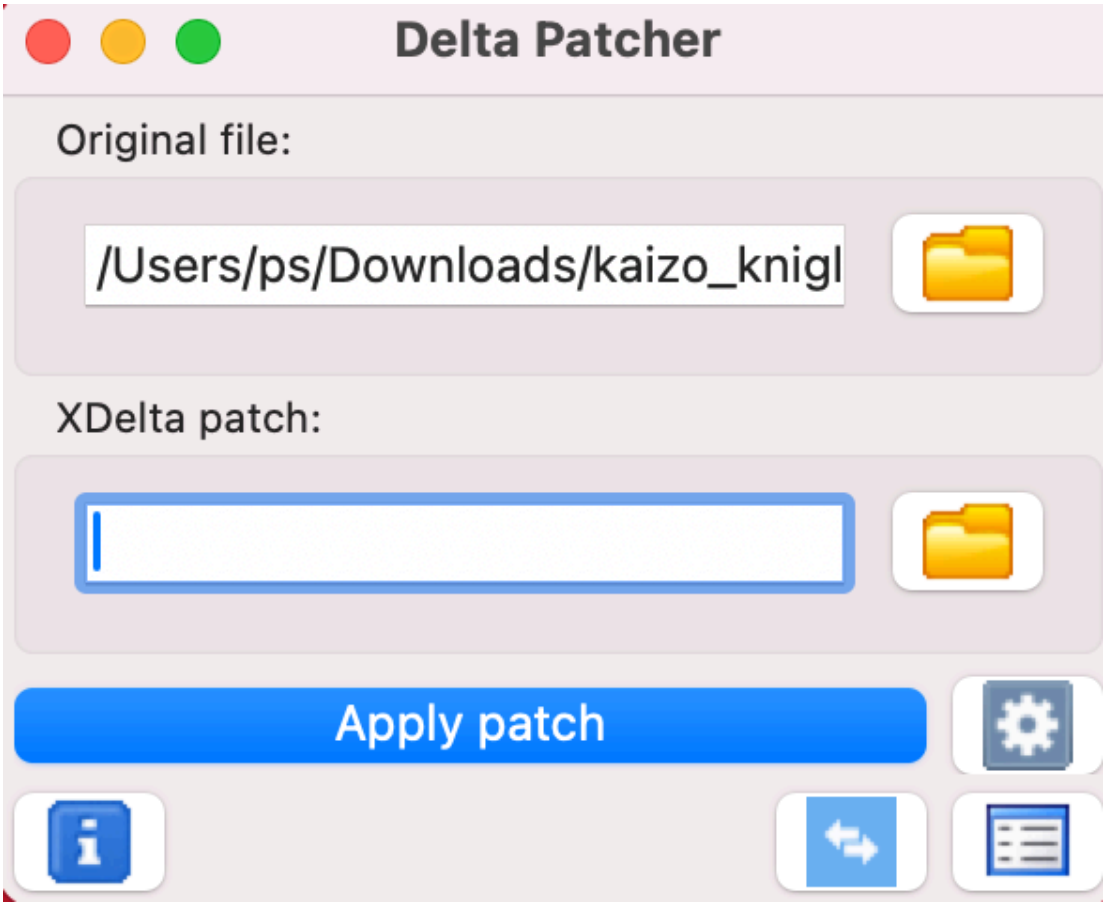

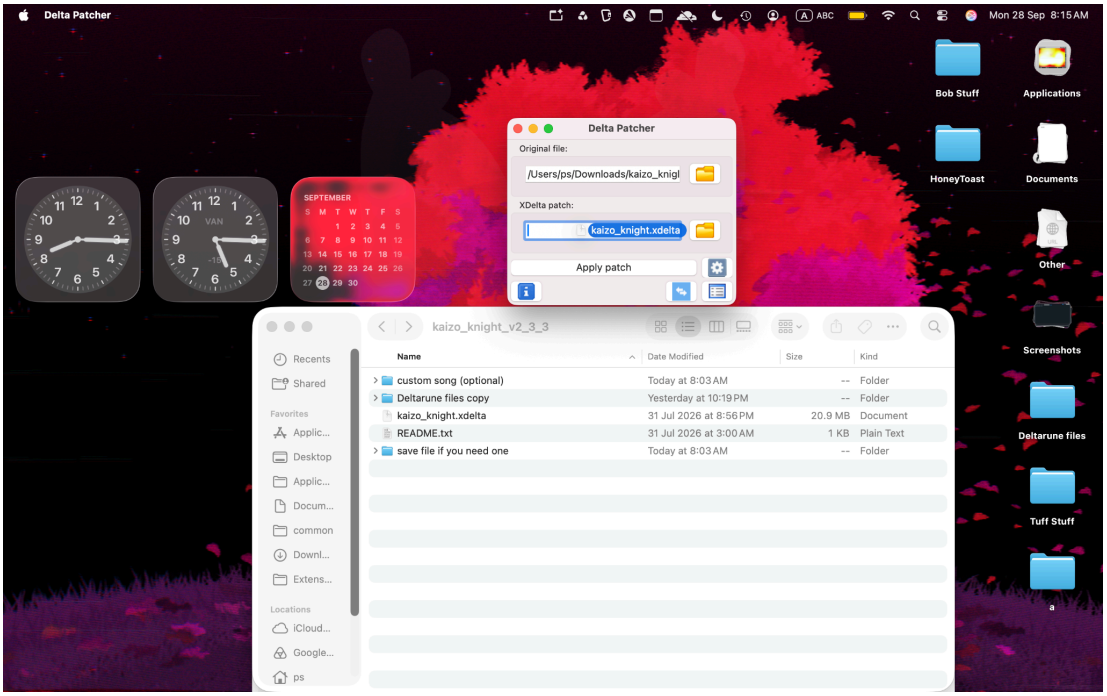

13) Next, you want to locate the data.win of the chapter file you would like to patch, in my case, I want to patch chapter 3 because it has the roaring knight fight, so I would go into Deltarune files copy, chapter3_windows, and look for the data.win file, if you need to patch multiple files, do step 13 -15 until all your files are patched
14) Next, open Delta Patcher.
15) Now, you want to drag the data.win of your chapter into Delta Patcher's original file section

You should see a path pop up in the top section

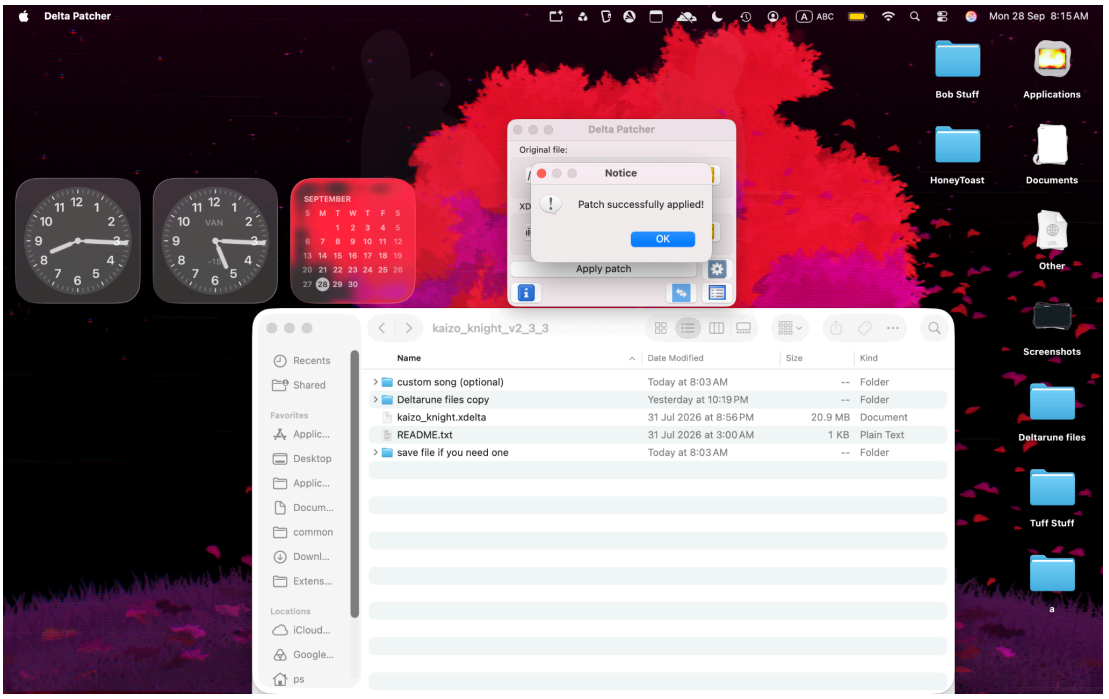

16) Next, for the XDelta patch section, drag the .xdelta file in, if you have multiple, use the one that is for the current chapter, eg chapter 1's data.win file goes with chapter 1's .xdelta file

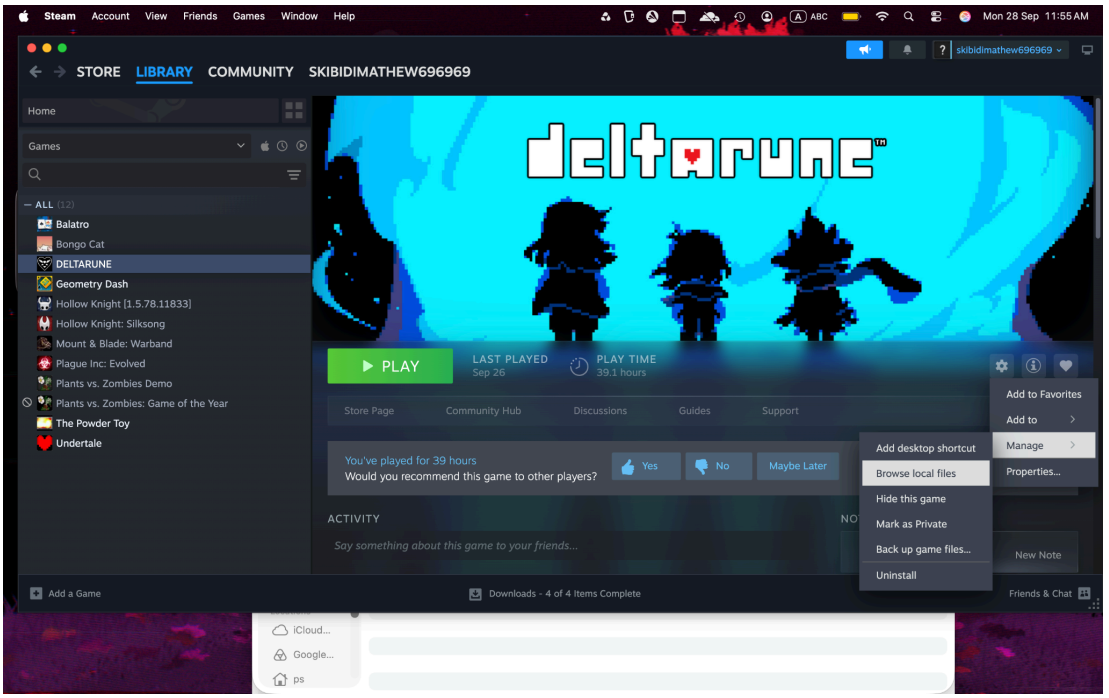

17) Next, click Apply patch and wait for this prompt, if it says the file you are patching is wrong, make sure you are patching the data.win inside the chapter and not in the

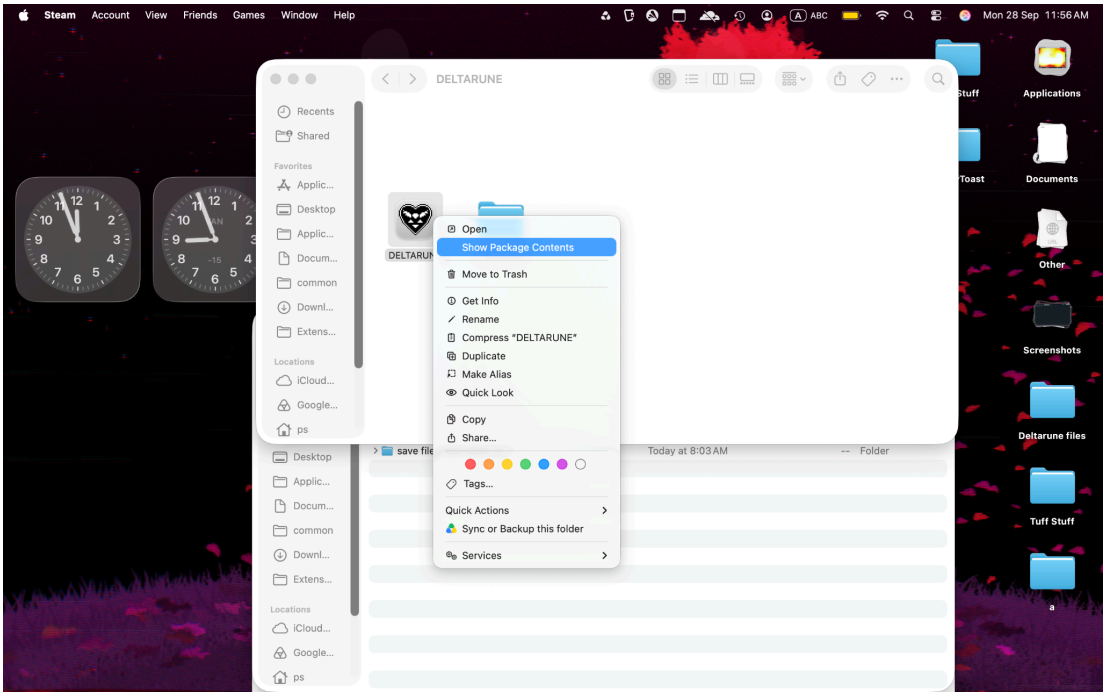

base directory

18) Next, rename the patched file to game.ios, and then reinstall DELTARUNE after quitting and reopening it, this will install mac files.
19) Lastly, click on Browse local files in the DELTARUNE Steam page

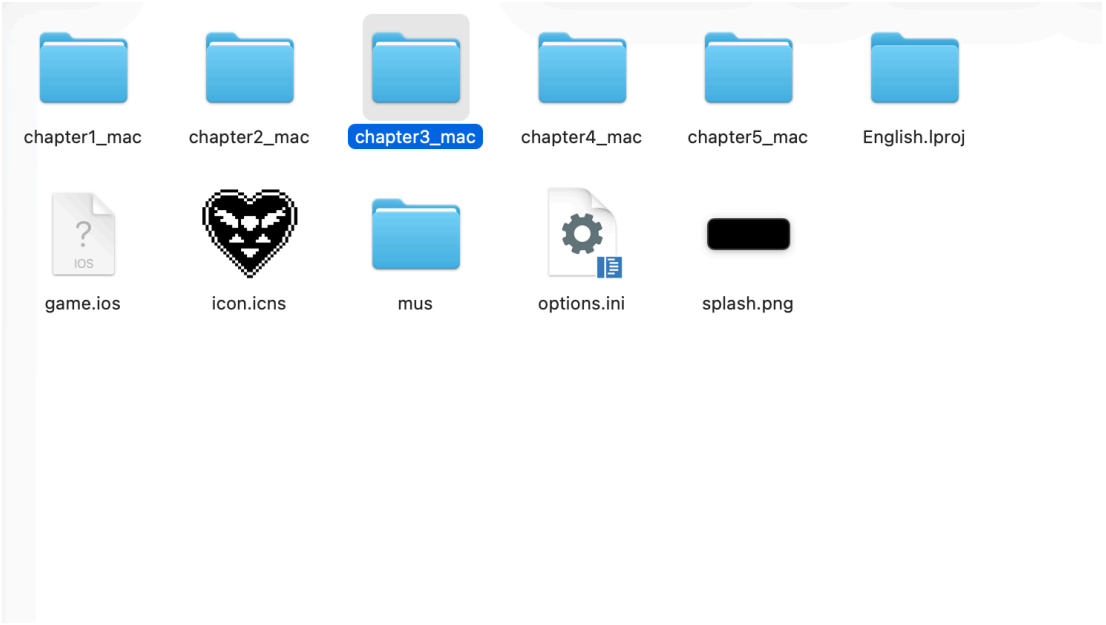

20) Now, when it shows you this, right click DELTARUNE and press Show Package Contents

21) When it shows you the “Contents” folder, double click on it, and when you are shown a bunch of folders, click “Resources”

22) Now, double click on the Chapter folder that you would like to mod, in my case, I'm modding chapter 3.

23) Lastly, go to your downloaded mod directory, find the data.win file that you patched, and rename it to game.ios, and then, drag it from chapter[__]_windows to chapter[__]_mac. When it asks if you want to replace it, say yes.

24) Now, boot up DELTARUNE and select the patched chapter.
